# Lecture 2 Propositional Logic & SAT

Zvonimir Rakamarić University of Utah

#### **Announcements**

- Homework 1 will be posted soon
- Propositional logic: Chapter 1 of our textbook
  - You can download it for free as a PDF

# Syntax of Propositional Logic (PL)

```
truth_symbol ::= \top (true), \bot (false)
variable ::= p, q, r,...
atom ::= truth_symbol | variable
literal ::= atom | ¬atom
formula ::= literal |
             ¬formula |
             formula \( \) formula |
             formula \tag{ formula |
             formula \rightarrow formula |
             formula ↔ formula
```

# Examples of PL Formulae

```
F: ⊤
```

$$F:(p \land q) \rightarrow (p \lor \neg q)$$

$$F: (p \vee \neg q \vee r) \wedge (q \vee \neg r)$$

$$F: (\neg p \lor q) \leftrightarrow (p \rightarrow q)$$

$$F: p \leftrightarrow (q \rightarrow r)$$

#### **Semantics**

- Semantics provides meaning to a formula
  - Defines mechanism for evaluating a formula
  - Formula evaluates to truth values true/1 and false/0
- Formula F evaluated in two steps
  - Interpretation *I* assigns truth values to propositional variables
     *I*: {p → false, q → true...}
  - 2) Compute truth value of *F* based on *I* using e.g. truth table
- ▶ formula F + interpretation I = truth value

#### **Notation**

- Let F be a formula and I an interpretation...
- I [F] denotes evaluation of F under I
- If I [F] = true then we say that
  - F is true in I
  - ▶ I satisfies F
  - I is a model of F and write I ⊨ F
- If / [ F ] = false we write / ₱ F

# Example

F: 
$$(p \land q) \to (p \lor \neg q)$$
  
I:  $\{p \mapsto 1, q \mapsto 0\}$   
(i.e.,  $I[p] = 1, I[q] = 0$ )

p	q	$\neg q$	$p \wedge q$	$p \lor \neg q$	F
1	0	1	0	1	1

*F* evaluates to *true* under *I* or I[F] = true or  $I \models F...$ 

# Satisfiability and Validity

- F is <u>satisfiable</u> iff (if and only if) there exists I such that I ⊨ F
  - Otherwise, F is unsatisfiable
- ▶ F is valid iff for all I,  $I \models F$ 
  - Otherwise, F is invalid
- We write ⊨ F if F is valid
- Duality between satisfiablity and validity:
  F is valid iff ¬F is unsatisfiable

Note: only holds if logic is closed under negation

# Equivalence

Two formulae  $F_1$  and  $F_2$  are <u>equivalent</u>, denoted by  $F_1 \Leftrightarrow F_2$ , iff they have the same models

# Decision Procedure for Satisfiability

- Algorithm that in some finite amount of computation decides if given PL formula F is satisfiable
  - NP-complete problem
- Modern decision procedures for PL formulae are called SAT solvers
- Naïve approach
  - Enumerate truth table
- Modern SAT solvers
  - DPLL algorithm
    - Davis-Putnam-Logemann-Loveland
  - Operates on Conjunctive Normal Form (CNF)

#### **Normal Forms**

- Negation Normal Form (NNF)
  - ▶ Only allows ¬, ∧, ∨
  - Negation only in literals
- Disjunctive Normal Form (DNF)
  - Disjunction of conjunction of literals:

$$I_{i;j}$$

- Conjunctive Normal Form (CNF)
  - Conjunction of disjunction of literals:

# **Negation Normal Form**

To transform F into F' in NNF recursively apply the following equivalences:

$$\neg \neg F_1 \Leftrightarrow F_1 
\neg \top \Leftrightarrow \bot 
\neg \bot \Leftrightarrow \top 
\neg (F_1 \land F_2) \Leftrightarrow \neg F_1 \lor \neg F_2 
\neg (F_1 \lor F_2) \Leftrightarrow \neg F_1 \land \neg F_2 
F_1 \to F_2 \Leftrightarrow \neg F_1 \lor F_2 
F_1 \leftrightarrow F_2 \Leftrightarrow (F_1 \to F_2) \land (F_2 \to F_1)$$

# Example

 $F: p \leftrightarrow (q \rightarrow r)$ 

# Conjunctive Normal Form

To transform F into F' in CNF first transform F into NNF and then recursively apply the following equivalences:

$$(F_1 \wedge F_2) \vee F_3 \Leftrightarrow (F_1 \vee F_3) \wedge (F_2 \vee F_3)$$
  
 $F_1 \vee (F_2 \wedge F_3) \Leftrightarrow (F_1 \vee F_2) \wedge (F_1 \vee F_3)$ 

(Note: a disjunction of literals is called a clause.)

# Example

 $F: p \leftrightarrow (q \rightarrow r)$ 

# **Exponential Blow-Up**

- Such a naïve transformation can blow-up exponentially (in formula size) for some formulae
  - For example: transforming from DNF into CNF

# Tseitin Transformation [1968]

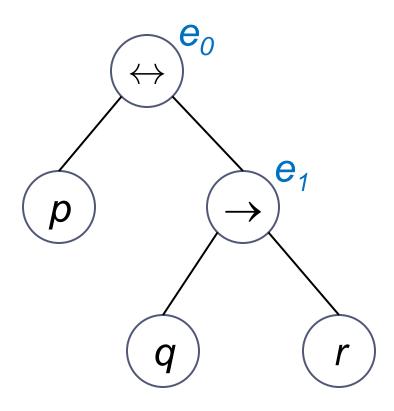

- Used in practice
  - No exponential blow-up
  - CNF formula size is linear wrt original formula
- Does not produce an equivalent CNF
- ▶ However, given F, the following holds for the computed CNF F':
  - F' is equisatisfiable to F
  - Every model of F' can be translated (i.e., projected) to a model of F
  - Every model of F can be translated (i.e., completed) to a model of F'
- No model is lost or added in the conversion

#### Tseitin Transformation – Main Idea

- Introduce a fresh variable  $e_i$  for every subformula  $G_i$  of F
  - $\triangleright$   $e_i$  represents the truth value of  $G_i$
- Assert that every e<sub>i</sub> and G<sub>i</sub> pair are equivalent
  - Assertions expressed as CNF
- Conjoin all such assertions in the end

# Example

 $F: p \leftrightarrow (q \rightarrow r)$ 

# **SAT Solver Input Format**

#### **Based around DIMACS**

```
c start with comments c p cnf 5 3 1 -5 4 0 -1 5 3 4 0 -3 -4 0
```

#### Classical DPLL

- Searching for a model M for a given CNF formula F
  - Incrementally try to build a model M
  - Maintain state during search
- ▶ State is a pair M | F
  - F is a set of clauses and it doesn't change during search
  - M is a sequence of literals
    - No literals appear twice and no contradiction
    - Order does matter
    - Decision literals marked with l<sup>d</sup>

# **Abstract Transition System**

Contains a set of rules of the form

$$M \mid F \Rightarrow M' \mid F'$$

denoting that search can move from state  $M \mid F$  to state  $M' \mid F'$ 

# DPLL Rules – Extending M

#### Propagate

$$M \mid G,C \lor l \Rightarrow M,l \mid G,C \lor l$$
  
**if**  $M \models \neg C$  and  $l$  not in  $M$ 

#### Decide

```
M \mid F \Rightarrow M, l^d \mid F

if l or \neg l in F and l not in M
```

# DPLL Rules – Adjusting M

Fail

$$M \mid G,C \Rightarrow fail$$
  
**if**  $M \models \neg C$  and  $M$  contains no decision literals

#### Backtrack

```
M,l^d,N \mid G,C \Rightarrow M,\neg l \mid G,C

if M,l^d,N \models \neg C and N contains no decision literals
```

#### Propagate

$$M \mid G,C \lor l \Rightarrow M,l \mid G,C \lor l$$
  
**if**  $M \models \neg C$  and  $l$  not in  $M$ 

#### Decide

$$M \mid F \Rightarrow M, l^d \mid F$$
  
**if**  $l$  or  $\neg l$  in  $F$  and  $l$  not in  $M$ 

Fail

$$M \mid G,C \Rightarrow fail$$
  
**if**  $M \models \neg C$  and  $M$  contains no decision literals

Backtrack

$$M,l^d,N \mid G,C \Rightarrow M,\neg l \mid G,C$$
  
**if**  $M,l^d,N \models \neg C$  and  $N$  contains no decision literals
